[Magic User's Manual](#) Jun 20 2020 The primary objective of this program was to further the research goals of AFOSR in plasma physics. MRC's role in this program was to collaborate with other AFOSR-sponsored researchers in the development and application of state-of-the-art computational methods to critical research problems. The principal mechanism for this collaboration was the joint research group. The objectives of this group includes not only the performance of superior research, but also the advancement of computational research methods by focusing the combined resources and capabilities of the entire community. The joint research group was established several years ago. Charter members include five universities (Texas Tech, Univ of Michigan, UCLA, MIT, and King's College) in addition to MRC. The research initially focused on problems such as plasma guns and microwave tube research. MRC provided the other participants with codes and related materials and, as their expertise grew, participated with them in their research and analyses and in the formulation of future research and modeling requirements. At present the group has expanded to include 17 universities and 6 government agencies. The scope of research has also expanded to include new topics, including novel beam emission sources and pulsed-power switches.

**MARTHA** Dec 27 2020 MARTHA is a set of general-purpose programs for analyzing linear electrical networks, available to users with access to APL time-sharing systems. The programs analyze, as a function of frequency, most linear "transmission-type" networks, with an input and an output. This includes most filters, amplifiers, microwave networks, and feedback systems, even if such circuits are relatively complicated, with multiple feedback paths and branches. The programs cannot handle some complicated interconnections of components, and are not set up to analyze nonlinear or time varying networks. The topology of the network is described using "wiring operators." The elements available include lumped and distributed, active and passive, reciprocal and nonreciprocal elements. The possible output includes tow-port parameters (impedance, admittance, hybrid, scattering, and ABCD matrices), as well as voltage gain, insertion gain, transducer gain, etc. These, their real or imaginary parts, or magnitude or phase, may be printed or plotted as functions of frequency or of each other. More than one network can be analyzed simultaneously. MARTHA is not inherently better at one frequency range than another, except perhaps in its repertoire of elements and response functions. MARTHA includes, besides R, L, and C, sixteen controlled sources; operational amplifiers; mutual inductance; three transistor models and the possibility of easily creating others; ideal transformers; several composite pi and tee structures; and a few exotic elements such as gyrators. For high-frequency applications MARTHA has several microwave elements, including TEM transmission lines, waveguides, attenuators, and isolators.

**Microwave Antenna Technology: OSU Reflector Antenna Code. User's Manual** Jun 01 2021 The major purpose of this research is to provide a computer aided analysis and design capability for microwave reflector antenna systems, in the 1-40 GHz range. This capability will allow for the prediction of antenna gain and antenna temperature performance of reflector antennas, under various atmospheric conditions. The analysis and design capability was accomplished in part by further development of the OSU Reflector Antenna Code. The analysis capability of the Reflector Code was used to guide the design of the seven reflector antennas, of both the focal point and Cassegrain types. These seven reflector antenna designs were fabricated and tested. The measured data obtained from these tests were used to validate the Reflector Antenna Code. The use of the Reflector Antenna code is documented in Volume III of this final report. This report documents the seven reflector antenna designs which were fabricated and measured to demonstrate and test the computer aided analysis and design capability. Selected pattern and gain data calculated by the Reflector Antenna Code and the validating measured data are given. A more comprehensive set of measured data for the seven reflector antenna designs is presented in Volume II of this final report.
