Remote Sensing Applications in Coastal Environment Jun 25 2020 Coastal regions are susceptible to rapid changes, as they constitute the boundary between the land and the sea. The resilience of a particular segment of coast depends on many factors, including climate change, sea-level changes, natural and technological hazards, extraction of natural resources, population growth, and tourism. Recent research highlights the strong capabilities for remote sensing applications to monitor, inventory, and analyze the coastal environment. This book contains 12 high-quality and innovative scientific papers that explore, evaluate, and implement the use of remote sensing sensors within both natural and built coastal environments.

Georgia Land Surveying History and Law Feb 26 2023 Georgia Land Surveying History and Law is the first definitive history and analysis of Georgia's land system and the laws that govern it. The book's opening section tells the story of the surveyor's role in transforming Georgia from a frontier to a bounded, populated, and productive colony and state. Paced by anecdotes of surveyors' wilderness experiences, the narrative traces the evolution of Georgia's land subdivision system, beginning with the original, and ultimately impractical, scheme of land granting and rectangular land subdivision under the Trustees of the Georgia Colony. The volume then covers the more flexible but easily abused headright procedure, and the subsequent lottery and succession of systematic, rectangular surveys under which most of the state was laid out and granted in the early nineteenth century. Finally, in lay terms supported by meticulous citation of authority, the volume discusses the legal aspects of land surveying, including the interests that make up land ownership, the transfer of real property, the interpretation of property descriptions, the location of boundaries, riparian and littoral rights, and other topics. The book examines every point concerning boundaries found in any Georgia case or statute. Based solidly on primary sources and the author's fifteen years of experience in land surveying and title abstracting, Georgia Land Surveying History and Law is an exhaustively researched and scholarly reference that will be useful to surveyors, title attorneys, title abstractors, real estate professionals, geographers, cartographers, historians, and genealogists.

Global Seagrass Research Methods Oct 10 2021 This thorough and informative volume presents a set of detailed, globally applicable techniques for seagrass research. The book provides methods for all aspects of seagrass science from basic plant collection to statistical approaches and investigations of plant-animal interaction. The emphasis is on methods that are applicable in both developing and developed countries. The importance of seagrasses in coastal and near shore environments, and ultimately their contribution to the productivity of the world's oceans, has become increasingly recognised over the last 40 years. Seagrasses provide food for sea turtles, nearly 100 fish species, waterfowl and for the marine mammals the manatee and dugong. Seagrasses also support complex food webs by virtue of their physical structure and primary production and are well known for their role as breeding grounds and nurseries for important crustacean, finfish and shell fish populations. Seagrasses are the basis of an important detrital food chain. The plants filter

nutrients and contaminants from the water, stabilise sediments and act as dampeners to wave action. Seagrasses rank with coral reefs and mangroves as some of the world's most productive coastal habitat and strong linkages among these habitats make the loss of seagrasses a contributing factor in the degradation of the world's oceans. Contributors from around the world provide up-to-date methods for comparable collection of ecological information from both temperate and tropical seagrass ecosystems.
