"This user's manual describes a longitudinal database designed to permit the storage, retrieval, and analyses of gunnery-related data generated with Army National Guard (ARNG) armored and mechanized infantry units. The database was developed as part of an assessment of the Simulation in Training for Advanced Readiness (SIMITAR) time-compressed gunnery training strategy, as implemented in a test ARNG armored brigade (Smith, in publication). It contains gunnery performance measures from this test brigade and from six other enhanced "comparison" brigades where the SIMITAR training strategy was not introduced. These measures were collected from 1993-1997 and include first-run and final, live-fire, Table VIII gunnery qualification scores, tank main gun ammunition expenditures, related measures/information needed for assessing the impact of different training strategy interventions, and space set aside for recording the outcomes of training aids, devices, simulators and simulations (TADSS) usage. The databases is configured within a software program known as the Statistical Package for the Social Sciences (SPSS, Version 6.1 for Windows). Its files can be exported in a number of formats, including spreadsheet and database management programs, as well as into a number of other statistical utilities. This user's manual will help ARNG database managers use the SIMITAR database as a convenient repository for gunnery performance and related information and as a resource for future gunner-related strategy impact investigations."--P.i. Advocating a user-centered approach to medical technology design, *Designing Usability into Medical Products* covers the essential processes and specific techniques necessary to produce safe, effective, usable, and appealing medical systems and products. Recently, the use of human factors engineering in product design has become much more widely accepted. It is gaining recognition as an essential part of the product design and development process for both consumer products and commercial products. The aim of this volume is to show how human factors technology can be effectively applied during the product design and development process to improve product usability, user-product performance, user satisfaction, and product safety. A second objective is to assemble a wealth of design information for human factors practitioners and others involved with the design of consumer and commercial products for both national and international markets. The book is also suitable as a text for courses and seminars concerned with the application of human factors technology to design. Earlier works on this topic have focused mainly on designing a few specific types of products, or have considered product design only within the context of human factors engineering in general. Available both in hardback and paperback, this is the first publication of its kind to focus on the subject of human factors in product design, providing a blend of theory, data, detailed examples, guidelines, and practical advice in one volume. With over 180 tables, figures, and photographs, as well as 640 references, extensive cross- referencing and keyword index, the volume will be essential reading for all those involved in work, research or study, related to product development.
