Increasingly nurses are developing and extending their clinical skills into areas that were once considered only for doctors. With the rise of post-registration clinical skills courses, advanced practitioners, and the new medical assistant roles, it is anticipated that future professional practice will involve more emphasis on clinical skills for nurses. The Oxford Handbook of Clinical Skills in Adult Nursing provides a practical, easily accessible, concise and evidence-based guide to all the essential elements of clinical skills for nursing practice in one portable format. The first section deals with the principles underlying patient assessment, and professional issues relating to clinical skills in order to help practitioners perform procedures safely and competently. This is followed by chapters on generic skills such as communication, hygiene and comfort, infection control, intravenous access, and care of the theatre patient. There are separate sections on drug administration and emergency and high dependency care. The book then takes a systems-based approach to the care of patients covering the key concepts which underpin all good nursing practice, including the social and psychological aspects of nursing. Information is included on how to relate the principles of clinical skills to different groups such as the elderly and the mentally ill, which will have relevance to practitioners whether in a hospital or community setting. A unique and comprehensive guide to clinical skills in nursing, the Oxford Handbook of Clinical Skills in Adult Nursing will help nurses and other health care workers to perform clinical skills safely and competently. Clinical procedures are vital to delivering safe and effective patient care within the prehospital setting, but it is not always easy remembering each step accurately during a time-critical situation. Packed with over 80 clinical procedures, this book is the go-to guide to familiarise yourself with the correct sequence and techniques for a range of different skills. Including both fundamental and more advanced paramedic procedures, it makes each procedure as easy to understand as possible with detailed step-by-step guidance and full-colour illustrations. Not only does the book explore prehospital skills in detail, it also provides the rationale and evidence behind them, so you can fully understand the underlying principles and feel more confident in your practice as a prehospital practitioner. Sections include: Patient assessment Airway Breathing Circulation Drug administration Trauma Cardiac arrest Infection prevention and control. This manual is aimed at

all healthcare practitioners, from novice to expert, who care for the critically ill patient, recognising that different disciplines contribute to the provision of effective care and that essential knowledge and skills are shared by all practitioners. It provides evidence-based guidelines on core critical care procedures and includes a comprehensive competency framework and specific competencies to enable practitioners to assess their abilities and expertise. Each chapter provides a comprehensive overview, beginning with basic principles and progressing to more complex ideas, to support practitioners to develop their knowledge, skills and competencies in critical care. Introduction: Hospitals are bound to provide a safe environment. Early defibrillation is a key factor in this respect. Outside in-hospital high-risk areas, the use of defibrillators is infrequent. However, even when rapid response teams (RRT) bring their own equipment, the benefit from early shocks strongly suggest their immediate availability. Currently there are no guidelines as to choice, placement strategies, or types/level of defibrillators for in-hospital settings, despite investment costs. Purpose: Development of rational criteria for type and placement of defibrillators for in-hospital settings. Methods: Literature research concerning the deployment of defibrillators in hospitals. We selected all hospitals and manufacturers in the Netherlands, using a standardized questionnaire, enquired as to their defibrillator investment and placement strategies. Using the literature and level-of competence legislation, we merged this into criteria for type and placement. Results: We were unable to find validated arguments supporting type/placement of defibrillator (AED vs manual) with a wide range of devices-to-patient ratios. Guidelines support deployment of a defibrillator anywhere in the hospital within 3 minutes. All respondents noted low incidence of use coupled with a low sensitivity to costs. We found that nurses prefer u2018realu2019 AEDu2019s over manual defibrillators with an AED function. Rational choice criteria were: a) population (in vs out of hospital), b) potential for collapse, c) user competence, d) arrival time RRT, e) time to retrieve, f) positioning same level within reasonable distance (visibility), g) u201ccombination with everything neededu201d (crash cart). Conclusions: A wide range of variation in placement strategies and type of defibrillators for the in-hospital setting in the Netherlands. (Cost) effective placement of defibrillators support use of AEDu2019s over manual defibrillators in RRT-based systems even though they may have negative effects. Potential users influence type/placement strategies. Some rational criteria allow for suitable and safe strategies. Endorsed by the Australian College of Critical Care Nurses (ACCCN) ACCCN is the peak professional organisation representing critical care nurses in Australia Written by leading critical care nursing clinicians, Leanne Aitken, Andrea Marshall and Wendy Chaboyer, the 4th edition of Critical Care Nursing continues to encourage and challenge critical care nurses and students to develop world-class practice and ensure the delivery of the highest quality care. The text addresses all aspects of critical care nursing and is divided into three sections: scope of practice, core components and specialty practice, providing the most recent research, data, procedures and guidelines from expert local and international critical care nursing academics and clinicians. Alongside its strong focus on critical care nursing practice within Australia and New Zealand, the 4th edition brings a stronger emphasis on international practice and expertise to ensure students and clinicians have access to the most contemporary practice insights from around the world. Increased emphasis on practice tips to help nurses care for patients within critical care Updated case studies, research vignettes and learning activities to support further learning Highlights the role of the critical care nurse within a multidisciplinary environment and how they work together Increased global considerations relevant to international context of critical care nursing alongside its key focus within the ANZ context Aligned to update NMBA RN Standards for Practice and NSQHS Standards In addition to providing rapid and effective therapy for ventricular tachycardia and fibrillation, the ICD is now capable of providing a full spectrum dual-chamber pacing as well as therapies for atrial fibrillation. Soon, it will also be able to provide treatment for congestive heart failure using multi-site ventricular pacing and provide continuous hemodynamic monitoring. This book serves as an introductory text to provide those who are relatively novice to this technology. In its manual form, it outlines the pertinent components of ICD functions and the basic differences among

the various models. Background: Manual Defibrillators underwent a rapid technical progress. The accurate use of a manual defibrillator can prevent a delay in starting CPR and reduce interruptions of chest compressions. In order to obtain an objective evaluation of a device's usability, eye-tracking measurements have recently become a promising method. Eye-tracking can expose cognitive processes and visual attention during problem-solving tasks, which is an important part of understanding human reasoning. It was the aim of this study to evaluate the usability of modern manual defibrillators from 4 different manufacturers. We requested a series of tasks representing typical operator/device interactions during a cardiac arrest scenario. Successful task execution and processing times were measured. Additionally, while the operators were performing the tasks, their visual focuses were assessed via mobile eye-tracking. Thereafter, their subjective perception of usability was evaluated by a standardized usability questionnaire. The hypothesis of our study was that the usability of manual defibrillators differs between the devices according to the requested task. Methods: After informed consent (ERB of the University of Freiburg), 43 voluntary operators were asked to execute 15 tasks representing typical operating steps during acute defibrillation, cardioversion or pace-maker stimulation (see Y-axis Figure 2), at 4 different defibrillators (Lifepak™ 20 (Physio-Control Inc., USA), Defigard Touch 7™ (Schiller, Switzerland), Corpuls 3™ (GS, Germany) and X Series™ ALS (Zoll-Chelmsford, USA) (Fig. 1). Operators were naïve to the included devices. The operators' gazes were measured via an eye-tracking device (Tobii Pro Glasses 2, Tobii AB, Sweden). From these data, task's processing time (TD) and the operator's gaze distribution (Heat Map) were analysed. After having executed the task, the operators evaluated the usability via a standardized questionnaire. The primary endpoint was TD. Secondary endpoints included gaze distribution and usability score (data given as mean ± SD). If you or someone you care about might need an implantable defibrillator or already has one, this easy-to-understand book provides lots of plain language information about how these devices work, what they do, and what things you should discuss with your doctor.
