It is so much in demand that even high schools have added programming in their curriculum. Programming and coding are often used interchangeably but both are different and you can read about them in this book. With every chore being digitized & becoming smart and automotive with the AI technology, learning to code has become the need of an era. Everything that you can possibly think of can be done using an app or a website from ordering a cab, or food or shopping online to watching movies or even taking a course & gaming skills. With applications being digitized the demand also increases for developers and programmers and hence learning a programming language would be beneficial. This book teaches how to learn the programming language of your choice and the correct way to begin your programming journey. As we know, to communicate with a person, we need a specific language, similarly to communicate with computers, programmers also need a language is called Programming language. Before learning the programming language, let's understand what is language? What is Language? Language is a mode of communication that is used to share ideas, opinions with each other. For example, if we want to teach someone, we need a language that is understandable by both communicators. What is a Programming Language? A programming language is a computer language that is used by programmers (developers) to communicate with computers. It is a set of instructions written in any specific language ( C, C++, Java, Python) to perform a specific task. A programming language is mainly used to develop desktop applications, websites, and mobile applications. Types of programming language 1. Low-level programming language Low-level language is machine-dependent (0s and 1s) programming language. The processor

runs low-level programs directly without the need of a compiler or interpreter, so the programs written in low-level language can be run very fast. How to find Nth Highest Salary in SQL Low-level language is further divided into two parts - i. Machine Language Machine language is a type of low-level programming language. It is also called as machine code or object code. Machine language is easier to read because it is normally displayed in binary or hexadecimal form (base 16) form. It does not require a translator to convert the programs because computers directly understand the machine language programs. The advantage of machine language is that it helps the programmer to execute the programs faster than the high-level programming language. ii. Assembly Language Assembly language (ASM) is also a type of low-level programming language that is designed for specific processors. It represents the set of instructions in a symbolic and human-understandable form. It uses an assembler to convert the assembly language to machine language. The advantage of assembly language is that it requires less memory and less execution time to execute a program. 2. High-level programming language High-level programming language (HLL) is designed for developing user-friendly software programs and websites.
