The definitive presentation of Soar, one AI's most enduring architectures, offering comprehensive descriptions of fundamental aspects and new components. In development for thirty years, Soar is a general cognitive architecture that integrates knowledge-intensive reasoning, reactive execution, hierarchical reasoning, planning, and learning from experience, with the goal of creating a general computational system that has the same cognitive abilities as humans. In contrast, most AI systems are designed to solve only one type of problem, such as playing chess, searching the Internet, or scheduling aircraft departures. Soar is both a software system for agent development and a theory of what computational structures are necessary to support human-level agents. Over the years, both software system and theory have evolved. This book offers the definitive presentation of Soar from theoretical and practical perspectives, providing comprehensive descriptions of fundamental aspects and new components. The current version of Soar features major extensions, adding reinforcement learning, semantic memory, episodic memory, mental imagery, and an appraisal-based model of emotion. This book describes details of Soar's component memories and processes and offers

demonstrations of individual components, components working in combination, and real-world applications. Beyond these functional considerations, the book also proposes requirements for general cognitive architectures and explicitly evaluates how well Soar meets those requirements. TuneCrack stands for: Crack the tuning problem - Learn to tune instruments precisely. The importance of tuning is often underestimated. However, tuning is a necessary step for every performance. TuneCrack has exercises to improve your listening skill and your pitch transfer skill. Your listening skill is trained with the Precision Listening Method. Your task is to solve ever more challenging questions: until a precision to the cent. Your transfer skill is trained with the Pitch Keeper Method. First, the program introduces you to your personal Absolute Pitch Point. With appropriate exercises and feedback you learn how to take over a pitch and keep the sound in your mind for an ever-lengthier time period. Transferring a pitch and keeping it in your mind is an important step in understanding the musical center of a piece. Since humans can only express pitch by singing, the program listens to you and gives you feedback based on your singing: a colored pitch line shows, if you are too low, too high or on target. The program tracks your progress and lets you see the statistics in graphical form. Thus, your weak and strong points get visible. Eliminate weak points by training. Build upon and extend your strong points. With your strong points start building an absolute pitch repertoire. If you're an active ham radio operator, you probably have a story about your first radio contact. Many hams remember that experience even more than their first license examination. To train your ear, one must learn to distinguish sounds. Acquiring Perfect Pitch requires in addition to remember pitches.

In early childhood we collect the vast part of our relevant sound memory by imitating the sounds with our vocal cords. However, our brain doesn't stop there. At a later age we can still learn a new foreign language. Three new methods to acquire Absolute Pitch and Relative Pitch, supported by software feedback, are presented in this book. The first method, the Singing Funnel method, lets you acquire Absolute Pitch like a foreign language. The second method, the Octave Anchor Pitch method helps you to orientate yourself in the pitch realm. The last method, the Interval Overtone method, improves your interval hearing. Windows XP represents the grand unification of two Microsoft dynasties: the corporate series (Windows NT and 2000) and the home series (Windows 95, 98, and Me). The result offers rock-solid stability and a modern new look -- but it still doesn't come with a printed manual. Book jacket.
