*Optimization of Structural Topology, Shape, and Material* Sep 09 2021 In the past, the possibilities of structural optimization were restricted to an optimal choice of profiles and shape. Further improvement can be obtained by selecting appropriate advanced materials and by optimizing the topology, i.e. finding the best position and arrangement of structural elements within a construction. The optimization of structural topology permits the use of optimization algorithms at a very early stage of the design process. The method presented in this book has been developed by Martin Bendsoe in cooperation with other researchers and can be considered as one of the most effective approaches to the optimization of layout and material design.

*Rail Quality and Maintenance for Modern Railway Operation* Apr 16 2022 In April 1990 a conference was held at the Cracow Institute of Technology, Cracow, Poland. The title of that conference was "Residual Stresses in Rails - Effects on Rail Integrity and Railroad Economics" and its themes were the measurement and prediction of residual stresses in rails, but, as the sub-title suggests, the intention was also to provide a link between research and its application to the practical railway world. At the Cracow conference there were 40 participants with 5 railways and 5 rail makers being represented and 25 papers were given. The Cracow conference was a success, and by March 1991 its off-spring, "The International Conference on Rail Quality and Maintenance for Modern Railway Operations", was conceived and birth was ultimately given in June 1992 at the Technical University, Delft. It turned out to be some baby, with 112 delegates from 24 countries taking part! As with its predecessor, the conference was to provide a forum for the exchange of ideas between research investigators, rail makers and railway engineers. A cursory examination of the list of participants suggests that about 57% were from the railway industry, 34% from universities and other research institutions and 9% from the steel industry. Bearing in mind that some of the railway industry participants were from

*Guitar Cultures Jan 01 2021 The guitar is one of the most evocative instruments in the world. It features in music as diverse as heavy metal, blues, indie and flamenco, as well as Indian classical music, village music making in Papua New Guinea and carnival in Brazil. This cross-cultural popularity makes it a unique starting point for understanding social interaction and cultural identity. Guitar music can be sexy, soothing, melancholy or manic, but it nearly always brings people together and creates a common ground even if this common ground is often the site of intense social, cultural, economic and political negotiation and contest. This book explores how people use guitars and guitar music in various nations across the world as a musical and symbolic basis for creating identities. In a world where place and space are challenged by the pace of globalization, the guitar provides images, sounds and styles that help define new cultural territories. Guitars play a crucial part in shaping the commercial music industry, educational music programmes, and local community atmosphere. Live or recorded, guitar music and performance, collecting and manufacture sustains a network of varied social exchanges that constitute a distinct cultural milieu. Representing the first sustained analysis of what the guitar means to artists and audiences world-wide, this book demonstrates that this seemingly simple material artefact resonates with meaning as well as music.*

*Computer Applications in Near Net-Shape Operations Jun 25 2020 Having edited "Journal of Materials Processing Technology" (previously entitled "Journal of Mechanical Working Technology") for close on 25 years, I have seen the many dramatic changes that have occurred in the materials processing field. Long gone are the days when the only "materials processing" carried out was virtually the forming of conventional metals and alloys, and when the development of a new product or process in a great number of cases called for several months of repetitive trial-and-error,' with many (mostly intuition- or experience-based) expensive and time-consuming modifications being made to the dies, until success was achieved. Even when a 'successful' product was formed, its mechanical properties, in terms of springback and dimensional accuracy, thickness variations, residual stresses, surface finish, etc. , remained to be determined. Bulk-forming operations usually required expensive machining to be carried out on the product to impart the required dimensional accuracy and surface finish. Over the years, the experience-based craft of metal forming has given way to the science of materials processing. With the use of the computer, forming operations can be simulated with accuracy, to determine the best forming route and the associated forming loads and die stresses, and to predict the mechanical properties of the formed product, even down to its surface texture.*

*The Concise History of Tennis Jul 07 2021 Complete tennis historyThe book describes the most important tournaments, players and matches for every year between 1877 and 2016 with many interesting facts. All available tennis history books tackle tennis history unevenly in two main respects. They usually give very little information on the pre-1919 years and do not give enough weight to professional tennis before 1968. These limitations are overcome in this book. One page is devoted for each year between 1877 and*

2016. Each page contains a short summary of the major events in that particular year, and year-end rankings in tabulated form that show the performance of the top players at the major events. World rankings Ever wondered who was the best player in 1889? Or in 1912? This book answers your questions with male and female world rankings for every year! The greatest novelty lies in the rankings, as no world rankings have yet been published before 1913, and professional players have usually been omitted from rankings before 1968. To arrive at his rankings, the author has taken into account contemporary classifications made by tennis journalists, and official national rankings. Player descriptions Containing hundreds of player descriptions, with more than 100 introductions before 1946 help you better understand the strengths and playing styles of the champions of early times as well.

*Translanguaging in Higher Education Jun 18 2022 This book examines translanguaging in higher education and provides clear examples of what translanguaging looks like in practice in particular contexts around the world. While higher education has historically been seen as a monolingual space, the case studies from the international contexts included in this collection show us that institutions of higher education are often translingual spaces that reflect the multilingual environments in which they exist. Chapters demonstrate how the use of translanguaging practices within the context of global higher education, where English plays an increasingly important role, allows students and professors to build on their linguistic repertoires to more efficiently and effectively learn content. The documentation of such practices within the*

*The Laws of Robots Jun 06 2021 This book explores how the design, construction, and use of robotics technology may affect today's legal systems and, more particularly, matters of responsibility and agency in criminal law, contractual obligations, and torts. By distinguishing between the behaviour of robots as tools of human interaction, and robots as proper agents in the legal arena, jurists will have to address a new generation of "hard cases." General disagreement may concern immunity in criminal law (e.g., the employment of robot soldiers in battle), personal accountability for certain robots in contracts (e.g., robo-traders), much as clauses of strict liability and negligence-based responsibility in extra-contractual obligations (e.g., service robots in tort law). Since robots are here to stay, the aim of the law should be to wisely govern our mutual relationships.*

*Manufacturing Processes 2 Feb 20 2020 The future of manufacturing companies depends largely on their ability to adapt to swiftly changing global conditions. These are exemplified by international competition, rapidly growing intercommunication and the increased significance of environmental issues [KLOC98a, ENGE02]. Precision machining with geometrically undefined cutting edges represents a key production engineering technology with high efficiency, security and machining quality. DIN norm 8589 subsumes within the group "machining with geometrically - defined cutting edges" the following material removal manufacturing processes: grinding, honing, lapping, free abrasive grinding and abrasive blast cutting. - chining is carried out in these production methods by means of more or less - regularly formed grains composed of hard substances brought into contact with the material. Of all methods understood as machining with geometrically undefined cutting edges, only grinding, honing and lapping can, strictly speaking, be considered precision machining. Free abrasive grinding and abrasive blast cutting, also treated in this book, represent a special group, as they generally cannot bring about geometrical change in the material.*
